### **How are fossils formed?**

Fossils are formed when an organism dies and is buried in sediment. Over time, the sediment hardens and turns into rock. The organism's remains

are slowly replaced by minerals, such as calcium carbonate or silica. This process can take millions of years.

### **What can fossils tell us?**

Fossils can tell us a lot about the past. They can tell us about the animals and plants that lived on Earth, and they can help us to understand how the Earth has changed over time.

Fossils can also help us to learn about the history of life on Earth. By studying fossils, scientists have been able to trace the evolution of different species over millions of years.
